$i(t) = I_{\max} \sin(\omega t)$  The instantaneous voltage across a pure resistor,  $V_R$  is “in-phase” with current. The instantaneous voltage across a pure inductor,  $V_L$  “leads” the current by  $90^\circ$ . The instantaneous voltage across a pure capacitor,  $V_C$  “lags” the current by  $90^\circ$ . Therefore,  $V_L$  and  $V_C$  are  $180^\circ$  “out-of-phase” and in opposition to each other. For the series RLC circuit above, this can be shown as:
