Philosophical and Empirical Approaches to Psychology: Mentalism vs. Anti-Mentalism philosophically analyzes four different approaches to psychology: introspectionism, behaviourism, cognitive psychology, and cognitive neuroscience to explore the concept of "the mind," which developed from the late nineteenth and early twentieth century up through present day psychology. The resulting ideas originating from these approaches are divided into two main groups in this book, mentalism (whose supporters assume that mind is not reducible to something else) and anti-mentalism (whose supporters assume that mind is indeed reducible to something else). This book argues that adopting one idea over another can have a profound influence in a psychologist's research. Further, the author shows that some controversial psychological notions like "consciousness" pertain to a particular mentalistic approach. Many psychologists do not consider such notions scientific, but he argues that this depends upon their adherence to a certain anti-mentalistic approach or to a specific mentalistic perspective. The book examines these issues by assessing experimental psychology in relation to neurobiology and philosophy, offering an integration of philosophical and theoretical chapters along with empirical and experimental chapters. Theoretically, the arguments draw from philosophy of psychology and experimental psychology. Using empirical research, Philosophical and Empirical Approaches to Psychology examines the role of the various mentalistic and anti-mentalistic approaches to psychology by integrating epistemological analysis and empirical research.

Cross-cultural psychology has come of age as a scientific discipline, but how has it developed? The field has moved from exploratory studies, in which researchers were mainly interested in finding differences in psychological functioning without any clear expectation, to detailed hypothesis tests of theories of cross-cultural differences. This book takes stock of the large number of empirical studies conducted over the last decades to evaluate the current state of the field. Specialists from various domains provide an overview of their area, linking it to the fundamental questions of cross-cultural psychology such as how individuals and their cultures are linked, how the link evolves during development, and what the methodological challenges of the field are. This book will appeal to academic researchers and post-graduates interested in cross-cultural research.

An international record of educational literature, institutions and progress.

In Elementary psychology the author has presented the subject in such a way that the student is able to understand the basic facts and theories in the background of real-life situations. Well before a new term or concept is introduced, the reader is prepared in advance to understand and accept it. An attempt is made in the present work to bring the topic of learning much closer to the readers life and endeavours and to integrate it with his day-to-day experiences of the world around him. In this treatment of motivation and personality, the author has drawn liberally upon his knowledge of psycho-pathology and the facts of social behaviour without which an understanding of the underlying dynamics of behaviour is not possible. An additional special feature of the book is the chapter on intelligence and aptitudes which prepares the student for a full-dress discourse on techniques of test construction at a later stage in his study of the subject.
